

Red Cross Light Arrow

Red Cross Light Arrow - Folding Top Panel
(with optional integral sign plate rack on an ISU body)

Chapter 8 of the Traffic Signs Manual now includes a new procedure, the “Mobile Carriageway Closure Technique” for temporarily closing the carriageway completely, allowing road works operatives to carry out their duties in a safe traffic free zone, whilst the traffic is slowed to a controlled halt and then briefly held at a standstill.

An essential part of this technique is the ability for the sign displayed on the operational vehicles to change from a ‘red cross’ and become a standard light arrow whilst on the move. For example, as the closure approaches a taper of cones in lane 3, the driver changes the sign to show ‘keep left’ and the cars following in that lane, filter into the adjacent lane before reaching the taper.

By offering a dual function ‘red cross’ and light arrow sign that is switchable from within the vehicle cab, contractors can make full use of this valuable technique but also have a normal function light arrow for other operations.

The Highway Care Red Cross Light Arrow construction is based on reliable engineering utilising dual colour LED lamps offering high visibility without risk of reflections associated with some alternative designs. The LED lamps have the additional advantage of increased life and durability with reduced power consumption and maintenance. All Highway Care light arrows have a full remote handset including diagnostic facility and the system is equipped with automatic multi-stage dimming. The dual function ‘red cross’ and motorway light arrow is available in a vertical lift or folding top panel configuration. The lower board has a micro prismatic, retroreflective sign facing, is angled at approximately 5° to avoid specular reflection (to comply fully with the requirements of Chapter 8 and material manufacturers specifications) and is complete with convoy sign and full width grey vinyl blind.
